An Essay on Croup
by
Thimor Willdin Jr. of Philadelphia

17

20

I purpose in the following pages to make a few observations on Croup. It is with diffidence I enter on a subject so often and ably treated of by many enlightened pathologists, but as some difference of opinion prevails among them, I shall not hesitate to present the views I have adopted, during the course of my medical studies, with respect to its nature and treatment.

Croup has been treated of by writers under different names; by Horne it was called Suffocatio Stridula, by Cullen, by ~~Spasmodic~~ Stridula, by Frank, Tracheitis by Darwin, a pleurisy of the Windpipe and in common language is called Whoop. But as each of denominations is somewhat objectionable, I shall content myself with the popular one of Croup.

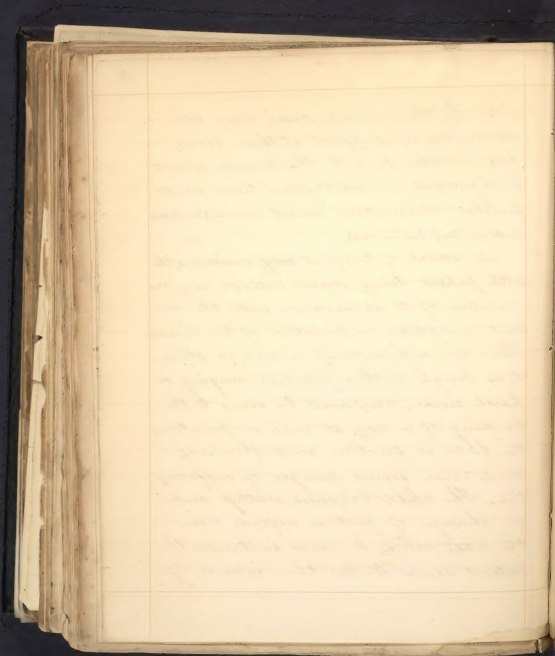

This disease is nearly confined to children from the second to the seventh year, rarely occurring after puberty and according to Cullen and others seldom attacking before the period of weaning. Robust children are mostly its subjects and those of the same family are often peculiarly predisposed to it. The time of its appearance is mostly in the Spring during austere damp weather, particularly if it be very changeable. It is met with generally near the sea coast, in some places it appears to be endemical, and has in few instances prevailed as an epidemic. On the subject of its contagious character a great deal has been said by some of the older writers, but the opinion was for many years abandoned, till lately revived by Dr Gregory and other English writers of some

note. By them many cases have been advanced in support of their views, but whether or not the disease must be regarded as contagious, time and further observations must decide. (See N. Amer. Med. and Surg. Journal No. 8.)

An attack of Croup is very insidious, the little patient being seized without any premonition of its appearance with the violent symptoms indicative of the disease. These are a hoarseness, a rough stridulous cough with a peculiar ringing or harsh noise, compared by some to the barking of a dog, at each inspiration the face is swollen and flushed, and there seems danger of suffocation. The child becomes restless and no change of posture affords him the least relief, in some instances the patient sinks under the violence of

these symptoms, but mostly the disease runs a more protracted course. Not being relieved we have the evidence of high febrile action, the circulation being accelerated and the disease continuing extends itself to the lungs constituting a case of Pneumony.

Taking into view the peculiar symptoms, I have detailed, I cannot agree in subscribing to the common received opinion with respect to the seat of this disease, for whatever have been the notions of physicians with regard to its nature, whether it depends on impacted mucus, inflammation or spasm they have almost uniformly placed it in the trachea. X
According to this belief we should, I believe, be at a loss to account for the barking cough and whizzing noise

the following are some of the
most important facts in the
history of the world as far as
the human race is concerned
and the progress of civilization
is concerned. The first of these
facts is the fact that the
human race has existed for
many thousands of years
and that it has made great
progress in all the sciences
and arts which are necessary
to the comfort and happiness
of the human race. The second
fact is the fact that the
human race has been divided
into many different nations
and tribes, each of which
has its own peculiar customs
and manners. The third fact
is the fact that the human
race has been the subject of
many wars and conflicts, and
that these wars and conflicts
have often resulted in the
destruction of whole nations
and the loss of millions of
lives. The fourth fact is the
fact that the human race has
been the subject of many
great revolutions, and that
these revolutions have often
resulted in the establishment
of new governments and
new systems of law and
justice. The fifth fact is the
fact that the human race has
been the subject of many
great discoveries, and that
these discoveries have often
resulted in the improvement
of the human condition and
the advancement of civilization.

of respiration which accompanies this disease. Did it depend on any affection of the trachea either thickening of its lining membrane or spasmodic action of its muscular fibres, these characteristic symptoms of the disease ~~would~~ not I think be produced; for we find the trachea to be a plain circular tube, and though its caliber were diminished some half or even one third of its usual size, we ought not to expect to hear more than a slight wheezing, owing to the rapidity with which the air would have to pass in order to supply the Lungs. As to the SOUNDS alone then we are to look for those striking phenomena of this disease. Whether we consider it as a wind or stringed instrument, still all will admit that it is the proper organ of

the voice or in other words that the modulations, which the sound presents as the air passes from the Lungs, depend on the vibrations communicated by it to the thyreo-articoid, ligaments. Though air be forced the a tube with the greatest possible rapidity, still we could not in any way produce those modulations without some vibratory motion could be imparted to it. In placing the seal of Bouge in the Larynx I do not deny that the Trachea and Bronchiae often and indeed in most cases are affected, but I am persuaded that without the Larynx being involved no barking voice will be heard.

Taking all these circumstances into consideration, I think we

would be justified in concluding that the true seat of Group is in the Larynx, and hence that the names of Quincke's Tracheitis which it received from Cullen and of Tracheitis from Hawk were founded on erroneous ideas of the subject.

It is the view I have adopted respecting the seat of Group founded solely on reasoning and the received opinions respecting the physiology of the Larynx; for, by a recurrence to the writings of Bland and Bonnet, it will be found to be sustained by a very large series of post mortem examinations conducted with the greatest care and assiduity. Passing now to the Pathology of the disease it will only be necessary to remark

that by an attentive consideration of all I have seen and read on the subject, I am led to the belief that Croup depends in all instances on an irritation of the living membrane of the Larynx amounting after a longer or shorter time, if not arrested, to inflammation and occasionally giving rise to spasmodic contractions of its muscles.

That this is a correct view of the nature of the case may be inferred from an analysis of all the symptoms, as well as from the analogy existing between this and other diseases of irritation. That inflammation does not exist in all cases we have the proof in the suddenness of the attack and

of the relief afforded by a few remedies of no great power and which will be mentioned hereafter and that spasm of the laryngeal muscles is not alone to be regarded as the cause of the symptoms, any one will be convinced who reflects that except through the agency of the will these muscles like all those covering other parts of the same membrane are seldom brought into action, except from the irritation of the mucous surface beneath them.

The all our present purposes Group may be divided into two species, the first consisting of all those cases in which the disease depends on irritation of the lining membrane, and the second of

those in which inflammation has supervened. Thus the cases which are suddenly produced appear to consist in simple irritation of the mucous lining of the Larynx, extending to and producing spasm of its muscles. This has at times been so violent as to close the laryngeal glottides and destroy the patient by suffocation. But this is not common and we find after a short time inflammation of the lining membrane taking place, constituting the second species of the disease, accompanied by a secretion of mucus, pus or coagulable lymph, according to the intensity of the inflammation and temperament of the patient. From the last of these (coagu-

able lymph) an adventitious membrane is formed, lining the whole internal surface of the organ and extending together with the inflammation along the internal surface of the Trachea and sometimes involving the Lungs.

The Gurgling noise which accompanies and indeed characterizes Croup and the difficulty of breathing may I think in many instances be attributed to spasm of the laryngeal muscles, but the same symptoms are often produced by a thickening of the mucous membrane from inflammation and pendulous of spasm, and also from the presence of the adventitious membrane. The appearances on dissection go to confirm this view of the

nature of Croup. In cases which have terminated suddenly no marked appearances are discovered. But when it has continued for a few days a even till the usual signs of inflammation are met with in the Larynx and generally in the trachea. There is also found in the Larynx and Trachea a quantity of thick matter resembling mucus and when the disease has been violent an adenitious pneumonia, as has been before observed.

The Causes of Croup are those of the Influenza, generally, particularly cold and damp air. Dr. Boerhaave, in his chapter on Croup, named of P. Linnæus says that exposure to the weather is most necessary to its production, "Sed," he observes, "we have often witnessed attacks of the disease from the mere

prevalence of a North-East wind, and
 where in consequence of this wind
 every precaution has been taken to
 guard against its influence by, con-
 fining the child and keeping it
 warm.

A stomach loaded with acid
 digesta is said by Dr. Chapman
 to be a very fruitful source of
 the disease, and here, I might remark,
 we can assign a reason why Croup is sel-
 dom met with previous to weaning, the
 child being nourished by the Mammary
 substance provided for its support with-
 out any irritation of its tender stomach.

Catarrh, as is acknowledged by almost
 every writer, is sometimes complicated
 with this disease. Nor is the circum-
 stance difficult of explanation, for
 the inflammation which constitutes

color: it may readily be understood
to extend into the Larynx and
give rise to the symptoms charac-
teristic of Croup. The disease also
occasionally accompanies the Inma-
tion, of the Larynx, Paratonsillar, Aphthous sore
throat and in some instances is
accompanied by unequivocal signs
of Catarrh. In all these, except the
last, the Pharynx being inflamed,
the inflammation extends to the
Larynx. In all these cases however
we only describe complications so
commonly found in all diseases
and they cannot in the least in-
cline us to the supposition that
the nature of Croup is different in
such instances from what it is
when simple and uncomplicated.
Giving to Croup accompanying these

diseases it was formerly divided into Idiopathic and Symptomatic, but as all these causes tend to the same end, namely, irritation of the lining membrane of the Larynx, and as we cannot under any pretence suppose that Croup can be a symptom of any other disease, but must in all instances be a disease of itself, sometimes existing alone, at other times complicated with other affections, but in all cases marked by its own, peculiar symptoms, and demanding its proper treatment we are led to the conclusion that the distinction is neither pathologically correct nor practically important.

Whatever may be the difference of opinion with respect to the pathology

of Greek Physicians pretty nearly agree in the most important point namely its treatment.

Should it arise in the course of an emetic will sometimes check its progress. In those cases which arise from ingesta, they are useful in getting rid of offensive matters and in all cases they tend to restore an equable circulation. It is well known that impressions made on the stomach are felt by the whole system and the flow of blood and vital action are diverted from the seat of the disease to the organ acted on and secondarily to the skin.

Contributing to the same end the warm Bath may, if necessary be employed. In relaxing spasm

this is one of the most important remedies that can be adopted, and by determining the vital reaction to the skin it may act as a revulsive and thus contribute to relieve the irritation of the Larynx. Spirits of Turpentine or a Mustard cataplasm may also be applied to the throat.

But the disease existing all these remedies, recourse must be had to others and first to Bloodletting. In the epidemic of pneumonia in all sporadic and inflammatory diseases, no one at the present day doubts, and in Tracheitis it is particularly required. In its employment we have no other guide than a subsidence of the distressing symptoms. It is some-

times even necessary to almost drain the system before its full effect is obtained. This is particularly the case when the inflammatory action is established. When Sparging is employed the action is not subdued, but only abated, while at the same time there is an expenditure of blood without profiting the patient, and he will not so readily bear the lancet the second time which will sooner or later become necessary. This practice is recommended by nearly all who are conversant with the disease.

After venesection has been carried to the extent I have mentioned and the unpleasant symptoms continuing, there is good rea-

son to believe that the inflammatory action is completely established. The course may now be had to topical depletion "by cups to the back of the neck," and leeches to the throat. "In the last of these objections have been made, but when we consider their immense utility in allaying local inflammation in other parts, when preceded by copious section, I think we are hardly warranted in their use. They serve to unload the vessels of the part of that state of congestion "without which," as has been justly observed, "inflammation cannot take place," they should not however be used before or as a substitute for general bleeding for unless the system be first

perhaps reduced than might sub-
 tend to increase the disease, by
 inviting a flow of blood to the
 part, by their irritation. Their want
 of success, in some cases in which
 they have been tried, is perhaps
 owing to this circumstance. At
 this circumstance the application of
 a blister might, probably, prove
 serviceable.

By the foregoing treatment the
 violent symptoms of Gout are
 generally subdued, and it is neces-
 sary to pay some attention to the
 state of the bowels. These are gene-
 rally in a torpid state, and a
 purge becomes necessary. Calomel
 either alone or combined with
 Rhubarb or Jalap may be ad-
 ministered. The importance of

this practice is very great; by it we do away the disposition to inflammation, first by inviting the flow of blood and irritation from the Lungs to the intestinal surface, and secondly by the depletion then occasion from those parts.

In most cases Croup leaves behind it a slight cough and hoarseness which are best relieved by the use of expectorants. My Father at illayian the *Polygala* *la Senega* has been much recommended, but more, I believe, may be expected from this ~~medicine~~ in combination with the Squill and Tartar Emetic in the form of the Compound Symp of Squill of the Dispensatory. This

was first introduced by Dr. Byce, and to him we are indebted for the formula. Its value was soon appreciated by other members of the profession, and at the present time it is a very popular remedy in domestic practice, so much so that there are few mothers, whose children are affected with this disease, who do not only resort to it to break up the remains of an attack, but often by its timely administration ward off an attack.

I have now described the treatment of Croup as it usually presents itself but should the inflammation run on to the formation of a membrane we are advised in addition to the usual remedies to en-

7
 endeavour to get rid of it; and for
 this purpose Emetics have been used.

These are, I express, very equivocal
 remedies operating purely
 mechanically.

The operation of Tracheotomy
 has also been recommended
 for its removal. This, though
 performed by Dr Physick in se-
 veral instances, has never, I be-
 lieve, succeeded, though in all
 the cases the patients were ra-
 pidly sinking. Could we clear
 the Trachea of any obstruction
 that might exist we should
 accomplish nothing, as we have
 good reason to believe that the
 Larynx is covered by a simi-
 lar membrane, to remove which,
 I am persuaded, would be

impossible. But admitting we could
get rid of the membrane we would
not, by ~~that~~ means, overcome
the action that produced it, and
in such an emergency, little ex-
pectation of a recovery is to be loo-
-ked for; and I should be more
content with keeping the pa-
-tient in the best position for
breathing, and endeavouring to
overcome any spasmodic or
inflammatory action that
might exist.

When Croup is complicated
with other diseases, these demand
attention and the remedies pro-
-per for them should be had
recourse to, at the same time
we should endeavour to remove
the affection of the Larynx.

unhappy. The country in which
we live is a land of
unhappy people. The people
of this country are
unhappy. They are
unhappy because they
are poor. They are
unhappy because they
are ignorant. They are
unhappy because they
are sick. They are
unhappy because they
are old. They are
unhappy because they
are young. They are
unhappy because they
are all of them.

I have now finished an account of my views with respect to the nature of Croup. Though hastily and imperfectly drawn up they have not been adopted without due consideration of the subject. 'Tis from the observations of others I have deduced them consequently they are in a great measure theoretical and I am ready to yield them to the lessons of experience.

I have been thinking of you
very much lately & wondering
how you are getting on.
I hope you are well & happy.
I have been very busy lately
but I have managed to find
some time to write to you.
